

1 **ABSTRACT**

2 A foldable tent has at least four frame loops in even numbers
3 sequentially and pivotally connected to form a tent frame by attaching
4 multiple easing pieces respectively between adjacent frame loops.
5 Additionally, at least one cover piece is attached to the frame loops to cover
6 the tent frame. Each easing piece is composed of two sleeves to be mounted
7 respectively around two adjacent parts of two adjacent frame loops and a
8 web formed between the two sleeves. Whereby, webs of every easing piece
9 provide surplus space for the frame loops to keep the frame loops from
10 squeezing each other when the foldable tent is folded.
